polylinker; Site_1: Not I; Site_2: ECo RI; The UI-R-Y0
library is a subtracted library derived from an
individually-tagged normalized whole-eye (mins the lens)
library. The driver for the subtraction consisted of a
pool of all previous libraries (UI-R-A0, UI-R-A1, UI-R-E0,
UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of
UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of
3-5 nucleotides present between the Not I site and the
oligo-dT track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-Y0) was constructed as follows: PCR
amplified cDNA inserts from previous library clones from
which 3' ESTS had been derived were used as a driver in
hybridization with the normalized whole-eye library in
the form of single-stranded circles (subtracted library) was purified
by hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into DH10B
bacteria (Life Technologies) to generate the UI-R-Y0
library. This procedure has been previously described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Email: msoares@blue.weeg.ulowa.edu

The sequence contained an oligo-dr track that was present in the oligouncleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dr track served to identify it as a clone from the normalized corpus striatum library cDNA library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH eccord will be updated accordingly when that means is determined. Seq primer: M13 Forward

-i- DOMAIN: INTACT BH3 DOMAIN IS REQUIRED BY BIK, BID, BAK AND BAX FOR THEIR KILLING ACTIVITY AND FOR THEIR INTERACTION WITH ANTI-APOPTOTIC MEMBERS OF THE BCL-2 FAMILY.

-i- SIMILARITY: CONTAINS A BCL-2 HOMOLOGY DOMAIN 1 (BH1).

-i- SIMILARITY: CONTAINS A BCL-2 HOMOLOGY DOMAIN 2 (BH2).

-i- SIMILARITY: CONTAINS A BCL-2 HOMOLOGY DOMAIN 3 (BH3).
                                                                                                                                                                                                                                                                                                                                                                                ANTAGONIZING THE APOPTOSIS REPRESSOR BCL-2 OR ITS ADENOVIROS HOMOLOG E1B 19K PROTEIN. INDUCES THE RELEASE OF CYTOCHROME C, ACTIVATION OF CASPASE-3, AND THEREBY APOPTOSIS.

-!- SUBJUIT: FORMS HOMODIRERS AND HETEROIMERS TOGETHER WITH BCL-2, E1B 19K PROTEIN, BCL-X(L), MCL-1 AND A1.

-!- SUBCELLULAR LOCATION: MEMBRANE-BOUND.

-!- ALTERNATIVE PRODUCTS: A 21 KD MEMBRANE PROTEIN ALPHA AND THE TWO CYTOPLASMIC PROTEINS BETA AND GAMMA ARE GENERATED BY ALTERNATIVE

-1- ALTERNATIVE PRODUCTS: TWO FORMS OF BCL-2: ALPHA, AND BETA, ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THEY ONLY DIFFER AT THERE C-TERMINAL ENDS.
-1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES, WITH HIGHEST LEVELS IN REPRODUCTIVE TISSUES. IN THE ADULT BRAIN, EXPRESSION IS LOCALIZED IN MITRAL CELLS OF THE OLFACTORY BULL, GERBELLAR GRANULE NEURONS OF HIPPOCAMPUS, PONTINE NUCLEI, GRANULE AND PYRAMIDAL NEURONS OF HIPPOCAMPUS, PONTINE NUCLEI, GERBELLAR GRANULE NEURONS, AND IN BPENDYMAL CELLS. IN PRENATAL BRAIN, EXPRESSION IS HIGHER AND LOCALIZED IN THE NEUROEPITHELIUM AND IN THE CORFICAL PLATE.
-1- DOMAIN: BH4 DOMAIN SEEMS TO BE INVOLVED IN THE ANTI-APOPTOTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                         adult rat brain.";
Neuroscience 61:165-177(1994).
-!- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE
ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF
VARIOUS STIMULI INDUCING CELLULAR DEATH. BCL2 BLOCKS APOPTOSIS
BECAUSE IT INTERFERES WITH THE ACTIVATION OF CASPASES BY
PREVENTING THE RELEASE OF CYTOCHROME C. MIGHT FUNCTION IN AN
ANTIOXIDANT PARHWAY TO PREVENT APOPTOSIS AT SITES OF FREE RADICAL
GENERATION SUCH AS MITOCHONDRIA.
                                                                                                                          "Expression of members of the bcl-2 gene family in the immature rat ovary: equine chorinoric gonadotropin-mediated inhibition of granulosa cell apoptosis is associated with decreased bax and constitutive bcl-2 and bcl-xiong messenger ribonucieic acid levels."; Endocrinology 136:232-241(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: FORMS HOMODIMERS AND HETERODIMERS TOGETHER WITH BAX AND

especially by rescuing cells from apoptosis

The present sequence represents "Deprenyl" (RTM)-induced protein (DIP),
a novel protein in neural cells. This protein is induced by the
neuroactive drug "Deprenyl" (RTM). DIP 1 and compounds which modulate
its activity can be used for the diagnosis and treatment of neuro-
degenerative disorders, particularly apoptosis in neural cells. Such
apoptosis is associated with diseases such as Alzheimer's, Parkinson's
and Huntington's, as well as cerebellar degeneration and oligodendrocyte
Sequence 225 AA;

This protein sequence comprises human BCL-XL, a protein capable of blocking or suppressing NF-kapa B (NF-kB) activation. A claimed method of genetically modifying a mammalian endothelial cell to render it less susceptible to an inflammatory or other immunological stimulus comprises inscrining into the cell to expressing the cell such that NF-kB activation of the cell; DNA encoding an anti-apoptotic protein able to inhibit NF-kB, and inhibited in the presence of the the cellular activating stimulus. Suitable anti-apoptotic proteins include A20 (see W31528), BCL-2.

C see W31529), BCL-XL and A1 (see W31531) and their deletion mutants capable of inhibiting NF-kB, such as polypeptides comprising amino cacid residues 5-24, 86-100, 129-148 and 180-195 of BCL-XL. Also calmed are: (1) a mammalian endothelial cell modified by the above
                                                                                                                                                                                                                                                                                                                                                                      77 AVKQALREAGDEFELRYRRAFSDLTSQLHITPGTAYQSFEQVVNELFRDGVNWGRIVAFF 136

Nucleic acid encoding apoptosis related gene bcl-w - used to induce or inhibit cell survival, e.g. for treatment of cancer and degenerative diseases desearative diseases.

This sequence represents a novel protein, bcl-w, encoded by the mouse this sequence represents a novel protein, bcl-w, encoded by the mouse to bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischemaia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant bel-w for the approach.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                  ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    viable in culture for an extended period. In contrast, if they act as cell death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites.

This is the amino acid sequence of the CDNA clone Bc1-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory alseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 FSDLAAQLHVTPGSAQQRFTQVSDELFQGGPNWGRLVAFFVFGAALCAESVNKEMEPLVG 120

New isolated "Deprenyl" (RTW)-induced protein - used to develop products for use in the diagnosis and treatment of neural disorders,
                                                                                                                                                         20-NOV-1998 (first entry)
Amino acid sequence of the CDNA clone Bcl-like (HAICH29).
Bcl-like (HAICH29); chronic inflammatory disease; allergic reaction;
Bmmunological disorder; autoimmune disease; anti-infectious agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

The present sequence is described of a derivative of human Boltwan by a pro-survival member of the Boltz family that is widely expressed and which is essential for spermatogenesis.

The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine carries a mutation is at least one allele of the human or murine substantially infertile, but possess no other major abnormalities a determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or cherwise facilitating spermatogenesis in animals, or which can induce infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121 QVQDWIVAYLETRLADWIHSSGGWADFTALXGDGALEDARRLREGNWA-VSTVVTGAVAL 179
